GROUNDWATER MONITORING SYSTEM CERTIFICATION
TEXAS MUNICIPAL POWER AGENCY
COAL COMBUSTION RESIDUALS UNITS: SITE F LANDFILL, ASH PONDS, SCRUBBER SLUDGE POND
GIBBONS CREEK STEAM ELECTRIC STATION
12824 FM 244 Road, Anderson, Texas

Amec Foster Wheeler Environment and Infrastructure, Inc. (Consultant) has been retained by the Texas Municipal Power Agency to develop Groundwater Monitoring Systems for the following Coal Combustion Residuals (CCR) Units: Site F Landfill, Ash Ponds, and Scrubber Sludge Pond. An evaluation of the Groundwater Monitoring Systems was conducted in support of verification that the System meets the design and construction requirements specified in 40 C.F.R. § 257.91. Presented below are the project background, limitations, and the Engineer's Certification.

1.0 BACKGROUND

Pursuant to 40 C.F.R. § 257.90(b)(1), owners and operators of existing CCR landfills and surface impoundments must develop a Groundwater Monitoring System, as required by 40 C.F.R. § 257.91. 40 C.F.R. § 257.91 requires owners and operators of a CCR unit to construct a Groundwater Monitoring System that consists of a sufficient number of wells, installed at appropriate locations and depths, to yield groundwater samples from the uppermost aquifer that accurately represent the quality of background groundwater that has not been affected by leakage from the CCR unit and accurately represent the quality of groundwater passing the waste boundary of the CCR unit. Pursuant to 40 C.F.R. § 257.91(f), the owner or operator must obtain certification from a qualified Professional Engineer stating that the System has been designed and constructed to meet the requirements of section 40 C.F.R. § 257.91.

In support of the Consultant's assessment, the Consultant evaluated the System for the above-referenced CCR unit, and prepared the document titled *Groundwater Monitoring Well Plan, Gibbons Creek Steam Electric Station Grimes County, Texas*, dated October 13, 2017. Based on past hydrogeologic assessment, and CCR unit design, the Consultant has determined that sufficient information is available to make the requisite certification.

2.0 LIMITATIONS

The Consultant's signature on this document represents that to the best of the Consultant's knowledge, information, and professional judgment, the aforementioned information is accurate as of the signature date. The Consultant's opinions and decisions are made on the basis of the Consultant's experience, qualifications, and professional judgment and are not to be construed as warranties or guaranties. In addition, opinions relating to environmental, geologic, and geotechnical conditions (or other estimates) are based on available data, and actual conditions may vary from those encountered at the times and locations where data are obtained, despite the use of due care.

3.0 CERTIFICATION

I, **Seth Green,** being a Registered Professional Engineer with the State of Texas, do hereby certify to the best of my knowledge, information, and belief, that the Groundwater Monitoring Systems for the Site F Landfill, Ash Ponds, and Scrubber Sludge Pond has been designed and constructed to meet the requirements of 40 C.F.R. § 257.91 and in accordance with recognized and generally accepted good engineering and scientific practices.

GROUNDWATER SAMPLING AND ANALYSIS PROGRAM
SELECTION OF STATISTICAL METHOD CERTIFICATION
TEXAS MUNICIPAL POWER AGENCY
GIBBONS CREEK STEAM ELECTRIC GENERATING STATION
ANDERSON, TEXAS

COAL COMBUSTION RESIDUALS UNITS:
SITE F LANDFILL, SCRUBBER SLUDGE POND, ASH PONDS

Amec Foster Wheeler Environment and Infrastructure, Inc. (Consultant) has been retained by the Texas Municipal Power Agency to install a groundwater monitoring network, develop a Sampling and Analysis Plan, collect baseline groundwater quality samples, perform data evaluation, and select the appropriate statistical method for evaluating groundwater monitoring data as required by 40 C.F.R. § 257.93. Presented below are the project background, assessment, limitations, and the Engineer's Certification.

1.0 BACKGROUND

Pursuant to 40 C.F.R. § 257.90(b)(2), owners and operators of new CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of a CCR unit, must develop a groundwater sampling and analysis program that includes selection of the statistical procedures to be used for evaluating groundwater monitoring data as required by 40 C.F.R. § 257.93. 40 C.F.R. § 257.93(f) requires the owner or operator of the CCR unit to select one of the specified methods to be used in evaluating groundwater monitoring data for each specified chemical constituent. The statistical method selected must be conducted for each constituent in each groundwater monitoring well, in the CCR Unit's Groundwater Monitoring System.

Pursuant to 40 C.F.R. § 257.93(f)(6), the owner or operator of the CCR unit must obtain a certification from a qualified Professional Engineer stating that the selected statistical method is appropriate for evaluating the groundwater monitoring data for the CCR Unit. The certification must include a narrative description of the selected statistical method.

In support of the Consultant's method selection, the Consultant evaluated existing groundwater quality data from prior groundwater monitoring events, and determined that sufficient information is available to make the requisite certification.

2.0 NARRATIVE DESCRIPTION OF CHOSEN STATISTICAL METHOD

Based upon a review of existing groundwater monitoring data for the Groundwater Monitoring Systems at the Site F Landfill and Scrubber Sludge Pond/Ash Ponds, the Consultant concludes the following:

The **Prediction Interval Procedure** statistical method, outlined in 40 C.F.R. § 257.93(f)(3), is the preliminarily selected method for evaluating the groundwater monitoring data. If, at a future date, a different statistical method is more appropriate for the data set, an alternative appropriate method from the remaining methods listed in 257.93(f) will be selected, and this Certification Statement will be revised and updated.

3.0 LIMITATIONS

The Consultant's signature on this document represents that to the best of the Consultant's knowledge, information, and professional judgment, the aforementioned information is accurate as of the signature date. The Consultant's opinions and decisions are made on the basis of the Consultant's experience, qualifications, and professional judgment and are not to be construed as warranties or guaranties. In addition, opinions relating to environmental, geologic, and geotechnical conditions (or other estimates) are based on available data, and actual conditions may vary from those encountered at the times and locations where data are obtained, despite the use of due care.

4.0 CERTIFICATION

I, **Seth Green,** being a Registered Professional Engineer with the State of Texas, do hereby certify to the best of my knowledge, information, and belief, that, pursuant to 40 C.F.R. § 257.93, and as of January 12, 2018, the selected statistical method is appropriate for evaluating the groundwater monitoring data for the Site F Landfill and Scrubber Sludge Pond/Ash Ponds. The statistical method selection process has been conducted in accordance with recognized and generally accepted good engineering and scientific practices.

Gibbons Creek Environmental Redevelopment Group, LLC

April 29, 2021

40 CFR §257.95(g) NOTIFICATION FOR STATISTICALLY SIGNIFICANT LEVELS OF 40 CFR PART 257 APPENDIX IV CONSTITUENTS ABOVE GROUNDWATER PROTECTION STANDARDS

On behalf of the Gibbons Creek Environmental Redevelopment Group (GCERG) and in accordance with the U.S. Code of Federal Regulations, Title 40, Part 257.95(g), this letter serves as a notification that one or more constituents in Appendix IV is identified at a Statistically Significant Level (SSL) exceeding the Groundwater Protection Standard (GWPS). The newly observed constituents that have been determined to exceed the GWPS is:

- Thallium

An Alternate Source Demonstration (ASD) was successfully completed during the 2019 Annual Groundwater Monitoring and Corrective Action Monitoring Report for multiple Appendix IV constituents. The 2019 ASD will be evaluated to determine if thallium exceedances may also be a result of alternate sources. The completed ASD will be submitted with the 2021 Annual Groundwater Monitoring and Corrective Action Monitoring Report.

Pursuant to Title 40, Part 246.105(h)(8), “Within 30 days of detecting one or more constituents in Appendix IV to this part at statistically significant levels above the groundwater protection standard, the notification as required by 257.95(g)”. This document herby satisfies this requirement.

Pursuant to Title 40, Part 257.106(h)(6), “Provide notification that one or more constituents in Appendix IV to this part that have been detected at statistically significant levels above the groundwater protection standard and notifications to land owners specified under 257.105(h)(8)”. GCERG owns the land in and around the affected area and is hereby notified.

Pursuant to Title 40, Part 257.107(h)(6), “Provide notification that one or more constituents in Appendix IV to this part that have been detected at a statistically significant level above the groundwater protection standard and notifications to land owners specified under 257.105(h)(8)”. This document serves as notification and will be available on the GCERG CCR compliance website.

This notice satisfies all recordkeeping requirements to provide notification for identifying Appendix IV constituent(s) that exceed the GWPS, as required by §257.105(h)(8), by placing this notice in the operating record. This document will be posted to the public CCR compliance website no later than May 7, 2021.

TABLE OF CONTENTS

LIST OF FIGURES

LIST OF TABLES

LIST OF APPENDICES

1.0 INTRODUCTION

Groundwater monitoring will be conducted at the active coal combustion residual landfill and ponds at the Texas Municipal Power Agency (TMPA) Gibbons Creek Steam Electric Station (GCSES) to comply with the requirements of the Coal Combustion Residuals (CCR) regulations found in 40 CFR parts 257 and 261. This groundwater monitoring plan includes procedures to be used to collect samples to comply with these regulations.

1.1 Monitoring Objectives

The groundwater monitoring objectives are as follows:

- Collect representative samples from the uppermost aquifer at the following designated CCR units (Figure 1.1)
    - Site F Landfill
    - Ash Ponds
    - Scrubber Sludge Pond
- Measure groundwater levels in the uppermost aquifer
- Determine groundwater flow rate and direction in the uppermost aquifer
- Determine background groundwater quality
- Evaluate whether a statistically significant increase over background levels has been detected for Appendix III to Part 257 constituents at monitoring wells at the waste boundary for CCR units

2.0 GROUNDWATER MONITORING NETWORK

Groundwater monitoring networks have been established at the three CCR units at the GCSES; the Site F Landfill, Ash Ponds, and Scrubber Sludge Pond. The monitoring networks are shown in Figures 2.1 and 2.2, respectively. Construction details for the monitoring wells that comprise the networks are summarized in Table 2-1. Borehole and well construction logs are provided in Appendix A.

2.1 SITE F LANDFILL MONITORING WELL NETWORK

2.1.2 HYDROGEOLOGIC SETTING

The Site F Landfill is underlain by stratified, heterogeneous layers of clays, silts, and sands of varying thicknesses. Sandstone was observed at some boring locations as well. The elevation of screened intervals in monitoring wells ranges from approximately 250 feet to 220 feet above mean sea level (amsl). The screened intervals are generally completed in silty sands (SM) with intervals of clayey sands and silts.

Groundwater investigations by others (ERM, 2013, 2014) indicated that groundwater flow direction beneath the Site F Landfill was generally northwest to southeast. Groundwater level monitoring

completed by Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler), using an expanded monitoring network confirmed the general groundwater flow gradient from northwest to southeast, but influence from the Gibbons Creek Reservoir on groundwater flow direction was observed.

2.1.3 MONITORING WELL LOCATIONS AND DESIGNATED USE

The Site F Landfill monitoring well network is shown on Figure 2.1 and consists of wells installed by Amec Foster Wheeler in 2016 and 2017, and wells installed by Black and Veatch in 1988.

The Site F Landfill monitoring network consists of the following wells:

- Background Well: MNW-18
- Boundary Wells: SFL MW-2, SFL MW-3, SFL MW-4, SFL MW-5, SFL MW-6, SFL MW-7, and MNW-15
- Water Level Only Wells: MNW-11, MNW-17, MNW-16

2.2 SCRUBBER SLUDGE POND/ASH PONDS MONITORING WELL NETWORK

2.2.1 HYDROGEOLOGIC SETTING

The Ash Ponds and Scrubber Sludge Pond are underlain by interbedded silty and sandy clays, clay, clayey sands and silty sand. Hard sandstone intervals are intermittently present, as are thin lenses of lignite or lignitic silts. Groundwater is considered confined to semi-confined, and generally encountered at depths of 30 to 40 feet below ground surface. The elevation of monitoring well screened intervals ranges from approximately 240 ft amsl to 220 ft amsl.

Groundwater investigations by others (ERM, 2013, 2014) indicated that groundwater flow directions are controlled by the local topography and a groundwater divide exists between the Ash Ponds and the Scrubber Sludge Pond. Groundwater level monitoring completed by Amec Foster Wheeler using an expanded monitoring network confirms the presence of the groundwater divide and flow direction to the east beneath the Ash Ponds. Groundwater flows to the southwest beneath the Scrubber Sludge Pond. The background groundwater quality monitoring well is located on the groundwater divide and provides background data for both networks.

Water level measurements in the most recently-installed monitoring well, AP MW-6, may be anomalously lower than the rest of the monitoring well network. Consequently, temporal trends in the well will be evaluated moving forward to assess whether the conceptual flow model should be revised.

2.2.3 MONITORING WELL LOCATIONS AND DESIGNATED USE

The Ash Ponds and Scrubber Sludge Pond monitoring well networks are shown on Figure 2-2, and consist of both monitoring wells and piezometers. The piezometers are used for water level data collection only, groundwater quality samples are only collected from monitoring wells.

The monitoring well network includes:

- Background Well: SSP/AP MW-1 (used as background for both The Ash Ponds and Scrubber Sludge Pond networks)
- Scrubber Sludge Pond Boundary Wells: SSP MW-2, SSP MW-3, SSP MW-4
- Ash Ponds Boundary Wells: AP MW-1D, AP MW-3, AP MW-4, AP MW-5
- Ash Ponds Piezometers: AP PZ-1, AP PZ-2, AP PZ-3, AP PZ-4

2.3 MONITORING FREQUENCY

The CCR regulations require the collection and analysis of a minimum of eight independent samples from each background and downgradient well for the constituents listed in Appendix III and IV of Part 257 by no later than October 17, 2017. In order to meet this requirement, monitoring was conducted and a bimonthly (every two months) schedule. Groundwater monitoring events have occurred in June 2016, August 2016, October 2016, December 2016, February 2017, April 2017, June 2017, and August 2017. Additional groundwater monitoring events were scheduled, as wells were added to the monitoring network.

Semiannual monitoring frequency for *detection monitoring* will be implemented after October 2017. The CCR rules allow for reducing the monitoring frequency to annually, based on the availability of groundwater. If annual monitoring is justified by the site-specific conditions, the sampling frequency will be adjusted.

2.4 ANALYTICAL PARAMETERS

As noted above, eight independent groundwater samples were collected prior to October 17, 2017, and analyzed for the Appendix III and IV constituents designated in Part 257, which are listed in Table 2-2.

Table 2-2
Constituents for Detection and Assessment
Monitoring under the CCR Rule

Constituent	MCL (mg/L)	Analytical Method	Reporting Limit
Appendix III to Part 257 - Constituents for Detection Monitoring			
Boron	--	E200.7	0.05
Calcium	--	E200.7	1
Chloride	--	E300.0	1
Fluoride	4	A4500-F C	0.1
Sulfate	--	E300.0	1
pH (std)	--	A4500-H B	0.1
Total Dissolved Solids	--	A2540 C	40
Appendix IV to Part 257 - Constituents for Assessment Monitoring			
Antimony	0.006	E200.7	0.05
Arsenic	0.01	E200.8	0.01
Barium	2	E200.7	0.01
Beryllium	0.004	E200.7	0.001
Cadmium	0.005	E200.7	0.01
Chromium (Total)	0.1	E200.7	0.01
Cobalt	--	E200.7	0.02
Fluoride	4		0.1
Lead	0.015	E200.8	0.01
Lithium	--	E200.7	
Mercury	0.002	E245.1	0.001
Molybdenum	--	E200.7	0.05
Radium 226		E903.0	
Radium 228		RA-05	
Radium 226 and 228 combined	5 pCi/L	A7500-RA	
Selenium	0.05	E200.8	0.01
Thallium	0.002	E200.8	0.01

When semiannual *detection monitoring* begins after October 2017, groundwater samples will be analyzed for Appendix III constituents only. In the event that a statistically significant increase over background levels has been detected for one or more of the constituents listed in Appendix III, the Site will enter *assessment monitoring*. During *assessment monitoring*, groundwater samples will be analyzed for all constituents in Appendix IV within the first 90 days of triggering the assessment monitoring program, and semi-annually thereafter. After two consecutive sampling events that demonstrate all constituents to be at or below background values, the Site monitoring program may return to *detection monitoring*.

3.0 FIELD SAMPLING PROCEDURES

The groundwater monitoring program involves collecting groundwater level measurements from the designated wells and piezometers and collecting groundwater samples from the designated wells. This section presents the specific procedures for performing these activities, including:

- groundwater monitoring locations,
- field measurement procedures and criteria,
- sampling methods,
- quality control sample protocols,
- sample container requirements,
- sample preservation methods,
- decontamination procedures, and
- documentation of sampling activities.

This section is intended to be a field manual, and provides field personnel with easy-to-use procedures and methods for consistently collecting quality, representative groundwater samples and measurements. Field personnel must understand and use these field sampling procedures (FSPs) during groundwater sampling events, consistently follow the specified procedures and protocols, and clearly document deviations from the FSPs, along with reasons for deviations.

Monitoring wells are listed in Table 2-1 along with their respective construction details. Borehole and well construction logs are provided in Appendix A. Appendix B contains field form templates for each monitoring event.

3.1 GROUNDWATER LEVEL MONITORING

Groundwater level measurements are collected from all monitoring wells and piezometers at the beginning of each monitoring event, and prior to sampling. Groundwater levels are measured to the nearest 0.01 foot, from their respective well reference points (i.e., the top of the inner casing).

Groundwater level measurements are compared to the most recent measurements obtained for that well or piezometer. If the measurements differ by more than 0.5-foot, a second groundwater level measurement is collected for verification purposes.

Groundwater levels are measured using a decontaminated water level indicator. If multiple meters are used, the calibration of each meter is checked for accuracy. The following procedures are followed each time water levels are measured in a monitoring well:

1. Turn on water level meter. Depending on the condition of the water level meter, the sensitivity may have to be adjusted by turning the power switch dial to the desired sensitivity level. Typically, the water level meter works best adjusted to a low sensitivity.
2. Press the appropriate button to test the meter.
3. Clean the meter and/or confirm that the meter has been properly decontaminated.
4. Open/unlock well head.
5. Don a new pair of nitrile gloves.
6. Water level readings are measured relative to the surveyed mark on the top of the well's inner casing. If a mark is not present, measure from the northernmost top of well casing.
7. Lower the water level meter probe into the well. When the buzzer sounds and/or the light turns on, stop the probe's descent. Gently raise the probe until the buzzing stops. Gently lower the probe until the buzzing starts again and stop. The cable should be immediately next to the measuring mark from now until the final reading is measured. If the buzzer stays on, or is very weak, adjust the sensitivity.
8. Without changing the hold on the cable, raise the probe out of the water and retest the measurement.
9. Keep adjusting the hand location until two identical readings are noted. Identical readings will be the same to 0.01 of a foot.
10. If the numbers on the cable can be observed, read the measurement at the mark to the nearest 0.01 foot.
11. If the numbers on the cable cannot be observed, place fingers around the cable at the location where the buzzer sounds relative to the reference point, pull the cable out without moving your hand with respect to its location on the cable, and record the reading.
12. If the two readings are within 0.01 foot, record the depth to water reading on the appropriate form.
13. Remove the probe from the well. Take note where the cable becomes wet. The cable and probe below this point needs to be decontaminated.
14. Decontaminate the probe and two feet (or the appropriate length if more than two feet immersed in water column) of cable by immersing in an Alconox® solution followed by immersing in tap water and deionized water rinses, respectively.
15. Spool the remaining cable.
16. Secure the probe in the holder.

17. Turn off water level meter.
18. Commence sample collection procedures or close and lock the well.

3.2 GROUNDWATER QUALITY MONITORING

Groundwater quality monitoring includes field and laboratory analyses. Only meters that were calibrated at the beginning of the work day are used to measure field water quality parameters, which include temperature, pH, dissolved oxygen (DO), oxidation-reduction potential (ORP), turbidity, and specific conductance (SC). Field water quality parameters are measured in a flow-through cell at regular intervals (typically every five minutes) during the low-flow process.

Samples analyzed by the contract laboratories are collected in new sample containers that are provided by the laboratory. Energy Laboratories, is the laboratory contracted by TMPA to provide analytical services.

3.2.1 Groundwater Sample Collection Procedures

The goal of groundwater sampling is to collect samples that are representative of in-situ groundwater conditions and to minimize changes in groundwater chemistry that would adversely affect analyte concentrations during sample collection and handling. To achieve this goal, groundwater samples are collected from the monitoring wells using U.S. Environmental Protection Agency's (EPA's) *Low Stress (low-flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells* guidance (EQASOP-GW4), and summarized below.

Beginning with upgradient wells first, and progressing sequentially through wells with the lowest to highest contaminant concentrations, groundwater conditions are stabilized and samples collected in a consistent manner for each well. A variable speed electrical submersible pump or peristaltic pump is used to purge and collect groundwater samples from well.

The following procedures will be used when groundwater from monitoring wells, using the low-flow, minimal drawdown method:

1. Arrive at well location and start to fill out Well Sampling Record. Fill out: Date, Time, Well ID, and Sampler.
2. Put on new nitrile gloves.
3. Using a decontaminated water level meter, measure and record the depth to water from the measuring point to an accuracy of 0.01 foot. The measuring point is marked on the top of the inner casing.
4. If using a submersible pump, decontaminate the pump and connect and tighten the dedicated tubing to the submersible pump. Verify that safety lead and electrical connections to the submersible are tight and secure.

5. Lower the submersible pump to the sampling depth. If using a peristaltic pump, feed the dedicated tubing down to the sampling depth, then connect the tubing to the peristaltic pump.
6. Verify that the control box is at the lowest setting and start the pump..
7. Adjust the setting on the control box to the point where water is produced from the well.
8. Measure and record the pumping rate in milliliters per minute (ml/min) by collecting the discharged water in a beaker or graduated cylinder. Adjust the controller setting as needed so that the flow rate is between 100 and 500 ml/min.
9. Once maximum discharge rate is achieved without lowering water level more than 0.3 feet, record the final purge settings on the Well Sampling Record for use in future sampling events. The purge time starts when the settings are adjusted.
10. Collect purge water into five-gallon plastic containers as needed.
11. Connect the discharge line to the flow-through cell.
12. After the flow-through cell is connected and air bubbles evacuated to the extent possible, water quality parameters (pH, DO, ORP, SC, temperature, and turbidity) and depth to water (DTW) are measured and recorded at approximate five-minute intervals. The relative percent difference (RPD) and delta calculations are conducted and recorded between the readings.
13. When the well has been purged for 60 minutes or field water quality readings have stabilized, the well is ready to be sampled. The field parameters are considered stable when three consecutive field measurements meet the criteria listed in Table 3-1. If the well has been purged for 60 minutes and the field parameters have not stabilized, it is noted on the sampling log, and samples are collected from the well.
14. Collect a groundwater sample following the sample collection procedures in Section 3.2.
15. Stop the pump. Disconnect the pump from the power source. If a generator is used, turn off the generator.
16. Place the sample bottles into a plastic bag and into a cooler with ice.
17. Disconnect the tubing from the submersible/peristaltic pump, secure the dedicated tubing in a clean, clearly labeled storage bag and secure the well cover. (The storage bag is placed in the on-site storeroom at the end of the day).
18. Decontaminate the water level meter and submersible pump (if used) following the procedures indicated in Section 3.8.
19. Pack up the equipment and mobilize to the next well.
20. The purge and decontamination waters can be discharged to the ground near the well or Ash Ponds or Scrubber Sludge Pond.

The submersible pump (if used) and dedicated tubing are positioned at the same depth (approximately halfway through the screened interval) in each well for each sampling event. The purge rates for each well typically are similar during successive sampling events. The purge rate

for the low-flow method wells initially can be set to the rate used in previous events and adjusted as needed based on current groundwater conditions.

3.2.2 Field Parameter Measurements and Stabilization

Field water quality data are recorded during well purging to determine when groundwater conditions in the well have stabilized, and representative formation water is being sampled. As stated above, field parameters are measured in a flow-through cell at regular intervals (typically every five minutes) during the low-flow purging process, and purging continues until the field parameters have stabilized based on the criteria summarized in Table 3-1, or until the maximum purge volume/time is met.

Table 3-1. Field Parameter Stabilization Criteria for Monitor Well Purging and Sampling

Parameter	Low-Flow Method
pH	+/- 0.1 S.U.
Conductivity	+/- 3%
Temperature	+/- 3%
Dissolved Oxygen	+/- 10% or +/- 0.1 mg/l if <2.0
ORP	+/- 10% or +/- 10 mV if < 100
Turbidity	<10 NTU or +/- 10%
Drawdown	<0.3’
Pumping rate	100-500 ml/min
Volume	No Criteria
Time	Maximum of 60 min

Notes: All percentages are relative percent difference.

.

The stabilization criteria are also listed on the well sampling forms in Appendix B.

3.2.3 Sample Collection

When the stabilization criteria are met, a groundwater sample is collected. Groundwater samples are collected from the pump discharge line directly into laboratory-supplied containers appropriate for the specific analysis being conducted. Specific procedures for collecting groundwater samples include the following:

1. Fill out the sample bottle labels using a pen with black waterproof ink. Place the preservative provided by the lab in the appropriate bottle(s).
2. Don new nitrile gloves.
3. Disconnect the pump’s discharge line from the flow-through cell.

4. Fill the sample bottles being careful not to overfill bottles with preservative.
5. Stop the pump.
6. Place the bottles into a cooler with ice.

Other general procedures that are followed during sampling include:

- Avoid rinsing the sample bottles before filling.
- Collect water sample from the pump's discharge line directly into laboratory-supplied containers appropriate for the specific analysis being conducted.
- Open only one sample container at a time. Immediately replace the container's cap and make sure the label is completed before starting to fill the next bottle.
- Minimize the potential for contamination to sample containers and equipment by sampling up wind and/or removing contaminants before opening containers. Common contaminants may include dust or other particulate matter.
- Immediately put the cap on each bottle after filling it.
- Place filled sample bottle into an iced cooler (except for radiochemical analysis) and enter sample information onto the appropriate chain of custody (COC) forms.

3.2.4 Sample Containers, Preservation, and Holding Times

Table 3-2 lists the number of sample bottles, the laboratory analyte(s), the type and size of the sample containers, the preservatives, and holding times. All samples are collected into new bottles supplied by the laboratory. If preservatives are added into the sample containers by the laboratory, that information is clearly marked on the container.

Table 3-2 Sample Parameter Groups, Container Sizes, Preservation Methods, Holding Times

Qty.(1)	Analyte(s)	Type-Size	Preservative	Method	Holding Time
1	Appendix III Constituents(2)	Polyethylene-1 L	None	No filter	28 days
1	Appendix IV Metals(3)	Polyethylene-500 ml (alternate - 16 oz.)	Nitric Acid to pH < 2	No filter	28 days for mercury, 6 months for others
1	Appendix IV Radium 226 and 228	Polyethylene-2L (alternate - 0.5 gal.)	Hydrochloric Acid to pH < 2	No filter	28 days

Notes: (1) Number of sample bottles filled for analyte(s).
(2) pH, total dissolved solids, boron, cadmium, chloride, sulfate, fluoride,
(3) Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, lithium, mercury, molybdenum, selenium, thallium.

"L"=liter
"ml"=milliliters

3.3 DOCUMENTATION OF FIELD ACTIVITIES

All field activities, including daily activities, sample locations and identification numbers, and significant observations or events, are documented by field staff on the appropriate forms. Specific forms for water level monitoring, equipment calibration, and groundwater sampling are included in Appendix B. The data are intended to record events in sufficient detail to allow personnel, at a later date, to reconstruct events that transpired during the life of the project. Entries are written in black indelible ink to allow preservation of information. The general documentation requirements are summarized as follows:

1. Entries will be legible.
2. Entries will be written in indelible black ink.
3. Mistakes will be corrected by drawing a single line though the error. Corrections will be initialed. No entries will be obliterated for any reason.
4. The tops of pages will be numbered sequentially and dated. The sampler will initial and date the bottom of each page and sign the last page for each day.
5. There will be no pages left blank.
6. Opinion or subjective material will not be entered into the logbook.

Each day, the following data are recorded in the logbook:

1. Project name and date.
2. Daily objectives and task progress throughout the day.
3. Weather (temperature, cloudiness, barometric pressure, wind).
4. Water quality and turbidity meters used (type, model).
5. Person calibrating meter(s).
6. Calibration results (buffers used with manufacturer, lot numbers, and expiration dates).
7. Problems calibrating meters.
8. Objective status at the end of the say, and issues encountered.

At each well, the following data is recorded in the logbook:

1. Well name and arrival time.
2. Person(s) sampling.
3. Purging method (low-flow or well volume).
4. QA/QC samples collected and the sample designation.
5. Samples preservation (ice, acid preservative).
6. Equipment decontamination procedures.
7. Decontamination/purge water disposal.
8. Comments (difficulties, questionable data, deviations from this plan, etc.).
9. Problems with field meters.
10. Visitors (name, title, organization).

3.4 SAMPLE IDENTIFICATION, DOCUMENTATION, AND CUSTODY

Collected samples are labeled in water-proof ink with the following information:

- sample name,
- date and time of collection,
- name or initials of person collecting the sample, and
- analyte list.

Similar information is also entered on the COC form, which remains with the respective collected sample through delivery to the analytical laboratory. Samplers maintain proper custody of their respective samples until delivery to the laboratory, or the samples are relinquished to another party. A sample is considered to be under a person's custody if:

- the sample is in the person's physical possession;
- the sample is in view of the person after that person has taken possession of the sample;
- the sample is secured by that person so that no individual can tamper with the sample; or
- the sample is secured by that person in an area that is restricted to authorized personnel.

Completed COC forms are delivered with the samples to the analytical laboratory. Each COC form must match the samples included in the associated cooler. The COC forms include the following information:

- Project name.
- Unique sample identification number.
- Unique COC number.
- Sample collection date and time.
- Sample matrix.
- Number and type of containers submitted.

- Preservation method, if applicable.
- Analyses requested for each sample.
- Special handling or analysis requirements.
- Courier shipment tracking number.
- Dated signature of the person collecting the samples.
- Dated signature(s) of persons, other than the sampler, involved in the delivery of the samples to the laboratory.
- Dated signature of the laboratory acknowledging receipt of the collected samples.

The COC form is filled out and signed in black indelible ink. The COC number and the date and time of delivery to the laboratory are noted in the field logbook. A copy of the COC form is delivered to and retained by the Project Manager.

3.5 SAMPLE PACKING AND TRANSPORT

Once collected, groundwater samples are packed for transport to the analytical laboratory. Care should be taken in packing the groundwater samples so that there is no damage to sample containers during transport to the contract laboratory. Samples are delivered to:

Energy Laboratories
1120 South 27th Street
Billings, Montana 59101

(406) 252-6325

Custody seals will not be required on the coolers if they are turned over directly to laboratory personnel at the time of delivery. Coolers delivered to the laboratory after hours will be placed in the designated receiving storage locker and custody seals placed on the right and left front and back sides across the gap between the lid and the cooler. The storage locker will be locked and the laboratory notified that coolers have been placed in the after-hours storage locker.

3.6 FIELD EQUIPMENT CALIBRATION

The field water quality meters are calibrated following the manufacturer's instructions. Except for temperature, pH, SC, DO, ORP, and turbidity are calibrated at the start of each day, and checked immediately after calibration, and at any time the meter is believed to be operating poorly. Calibration readings are recorded on the field calibration form, included in Appendix B. A meter is recalibrated when the reading is not within +/-10% of the standard solution or +/-0.20 pH units of the buffer solution. If the meter cannot be recalibrated, it is not used, and is sent to the rental supplier for repair.

At the end of each day of sampling, potential drift in parameter readings is evaluated by measuring standards for each parameter. The drift readings also are recorded on the field calibration form. Acceptable performance of the meter(s) is indicated by a drift of +/- 0.20 standard units for pH and +/- 10% for the remaining calibrated parameters.

3.7 SAMPLE DOCUMENTATION AND RECORDS

Field activities, including daily activities, sample locations and identification numbers, and any significant observations or events, are described in detail on the appropriate forms and/or in a field notebook. The activities and details, complete with time tags, are also written in the bound field logbook. There are individual forms for water level monitoring, equipment calibration, and groundwater sampling. Copies of these forms are included in Appendix B. The data are intended to record events in sufficient detail to allow personnel, at a later date, to reconstruct events that transpired during the life of the project. Entries are written in black indelible ink to allow preservation of data. Mistakes are corrected by drawing a single line though the error and the author initialing next to the deleted error. No entries will be obliterated for any reason.

3.8 EQUIPMENT DECONTAMINATION

Water level monitoring and non-dedicated groundwater sampling equipment that come in contact with groundwater are cleaned prior to use and between sampling locations. The non-dedicated submersible pump is decontaminated by pumping a series of solutions through the pump. The solutions are pumped in the following order: non-phosphate detergent (Alconox®), tap water, and deionized water. The last two feet of the water level meter cable is decontaminated by immersion in a non-phosphate detergent solution followed by immersion in tap water and deionized water rinses, respectively. After decontamination, equipment is stored and/or transported under clean conditions. Typically, equipment is stored in a clean plastic bag until reuse.

3.9 HANDLING AND DISPOSITION OF INVESTIGATION-DERIVED WASTES

Due to the low levels of target parameters, purge water can be discharged to the ground in the vicinity of the well. Alternately, purge water can be placed in the Ash Pond or Scrubber Sludge Pond.

4.0 QUALITY ASSURANCE/QUALITY CONTROL

4.1 STANDARD OPERATING PROCEDURES

The groundwater sampling procedures in Section 3.0 will be followed when collecting groundwater samples and measuring water levels and field parameters. The use of these standard operating procedures is meant to ensure consistency across multiple sampling events and possibly different personnel.

4.2 SAMPLE ANALYSIS VALIDATION

The type and reliability of methods used to analyze samples is important to ensure data quality. This section describes the collection of Quality Assurance/Quality Control (QA/QC) samples and the data review procedures that will be followed to ensure acceptable data.

4.2.1 Quality Assurance and Quality Control Samples

Samples are collected at regular intervals for QA/QC purposes. These samples include duplicate, field blank, and/or equipment rinse samples. The designations given to QA/QC samples and the associated original samples are documented on the sampling logs and in the logbook.

Duplicate samples are used to compare results from two separate samples taken from the same location at a rate of one duplicate per ten samples (or less). For each duplicate, a second set of bottles is filled following the same procedures as used for the original sample. The duplicate and original sample bottles are filled by alternating the discharge between the bottles after each one-third of the bottle is filled. Duplicate samples are designated by adding the suffix "-FD" to the well name from which the duplicate was collected (e.g., a duplicate sample from SFL MW-3 is designated as SFL MW-3 -FD). Wells selected for duplicate analysis change with each sampling event and are identified on the sampling log.

Field blanks and equipment rinsate blanks are collected during each sampling event. Blank samples are used to evaluate cross-contamination Each blank sample is a full bottle set with a unique sample designation. Field blanks are designated as "FB", whereas equipment rinse blanks are designated as "EQ". Each blank is sequentially numbered in the order collected starting with "01". The sample bottles are filled with deionized (DI) water in the same manner as the original sample. Field blanks are collected at a rate of one blank for every 20 samples (or less). Equipment rinsate blanks are collected when non-dedicated sampling equipment is used, at a rate of one sample per workday. Once sampling equipment has been decontaminated, DI water is pumped through the equipment into the appropriate sample bottles. The well locations from where field and equipment rinse blanks are collected are documented on the Well Sampling Record and the field logbook.

4.2.2 Data Review Procedures

To ensure quality data collection and compliance with CCR data quality regulations, a data review will be conducted for each sampling event. The contract laboratory will complete a review of the data in accordance with its internal laboratory guidelines and the applicable analytical methods used during sample analysis. Each data package from the laboratory will include a QC summary report.

A data usability review will be completed by Amec Foster Wheeler for each sampling event. A Data Usability Summary (DUS) will be prepared in accordance with TCEQ RG-366/TRRP-13. The DUS procedures were developed by the TCEQ for use in its Texas Risk Reduction Program but provide a common, known methodology for evaluating data usability. A DUS report will be prepared and included in the project file.
